PREFACE

This report on the characteristics of new housing in 1977 is derived from the Bureau of the Census's Survey of Construction, part of which is sponsored by the Department of Housing and Urban Development. The report includes chapters on the characteristics of single and multifamily housing completed during 1977, single-family houses sold during 1977 and a chapter on contractor-built houses started.

The Bureau of the Census is indebted to thousands of respondents included in the sample. Without their cooperation in providing information, this report would not have been possible. The Bureau also extends its appreciation to the field interviewers responsible for collecting the basic data.

Acknowledgment—Within the Bureau's Construction Statistics Division, David I. Siskind, Assistant Division Chief for Activity Surveys, and Jesse Pollack, Assistant Division Chief for Statistical Research and Methods, provided general supervision. Under the direction of William K. Mittendorf, Chief, Construction Starts Branch, Dale R. Jacobson developed the specifications and with the assistance of Steven Berman reviewed the data for publication. The sampling plan and quality control procedures were developed by Jesse Pollock, and Linda P. Hoyle. Under the direction of Ernest E. Sandoval, Chief, Programming and Procedures Branch, Barbara M. Walter developed the computer programs assisted by Howard R. Prouse, Charles A. Woods, Carl J. Savage, and Herbert S. Isham.

GENERAL INTRODUCTION

INTRODUCTION

This annual report on new housing is published jointly by the Bureau of the Census, U.S. Department of Commerce, and the U.S. Department of Housing and Urban Development. This report provides statistics on selected financial and physical characteristics of new housing. Where possible, the statistics have been adjusted to account for nonresponse. This was usually done when the nonresponse rate was less than 25 percent.

This report is divided into five chapters:

Chapter 1, New Housing Units Completed, provides monthly and annual data on new housing completions.

Chapter 2, Privately Owned One-Family Houses Completed, provides statistics on various characteristics of completed new one-family houses by purpose of construction. These statistics are shown for the United States, the four Census regions, and "inside" and "outside" of Standard Metropolitan Statistical Areas (SMSA's). Statistics were compiled for types of financing, with or without central air-conditioning, number of bathrooms, number of bedrooms, type of exterior wall material, number of fireplaces, kind of foundation, type of heating system, type of heating fuel, type of parking facility, number of stories, and square feet of floor area.

Chapter 3, Privately Owned Multifamily Housing Completed, provides statistics for the United States and four Census regions on selected physical characteristics of buildings having two units or more. Characteristics shown for buildings include the number of floors, number of units per building, with or without air-conditioning, and type of heating fuel. These characteristics are also tabulated by the number of units. In addition, units are tabulated by square feet, number of bedrooms, and number of bathrooms. Estimates are also provided for the median and average square feet per unit.

Chapter 4, New One-Family Houses Sold, provides statistics on financial and physical characteristics of new houses sold, which includes single family houses sold under condominium arrangements. Financial characteristics are shown from 1973. Most physical characteristics are shown only for the current year.

Chapter 5, Contractor-Built Houses Started, provides data on financial characteristics for new contractor-built houses started during 1977. This category covers custom-built houses; that is, houses built by a single general contractor on the owner's land for the owner's occupancy.

The statistics in this report are estimated from sample surveys and are subject to sampling variability as well as to errors of response and nonreporting. These statistics, may differ with similar data published by other Federal Government agencies because of differences in definitions, methodology, and sampling variability. Other principal sources of such data are:

1. Data on operations of the Federal Housing Administration (FHA) and Farmers Home Administration (FmHA).

The various publications of the FHA and FmHA provide more detailed data on the activities of those agencies and the characteristics of houses built under their respective programs.

2. Federal Home Loan Bank Board Series on Interest Rates and other Characteristics of Conventional First Mortgage Loans. The Federal Home Loan Bank Board series on conventional first mortgage loans on new houses include information obtained from institutional mortgage lenders on prices of new houses financed with conventional mortgages.

DATA REVISIONS

Previously published estimates of housing units completed, 1972 through 1976, and new one-family houses sold, 1973 through 1976, have been revised. The revisions reflect a recalculation of the data to correct for response and data processing errors that had accumulated over a period of years. The following tables show the differences between the previously published and revised estimates.

Since the differences were generally small, they were distributed in most of the tables by applying the percent distributions previously published to the revised subtotals. The only percent distributions recalculated are those in tables 16 and 17 which show number of units per building and table 18 which show houses sold by sales price categories. Averages and medians were not revised.

Revised data on the characteristics of housing units completed in 1972 are not shown in this report. However, the revised data can be derived by applying the percent distributions previously published to the appropriate subtotals shown in the tables appearing on the following pages. A copy of the report for last year can be obtained by writing to the Construction Statistics Division, Bureau of the Census, Washington, D.C., 20233.

S Withheld because estimate did not meet publication standards either on the basis of response rate, associated standard error,

or on the basis of a consistency review. X Not applicable. Z Fewer than 500 units or less than 0.5 percent.

All units in building are included in one size category based on average number of square feet per housing unit. The average was calculated using total square feet of all floors based on exterior dimensions divided by number of housing units in the building. Hallways, lobbies, elevator shafts were included in the total floor area; unfinished basements, common laundry rooms, etc., were excluded.

BRIEF EXPLANATION OF THE PRICE INDEX

The data used for computing the price index are obtained from the Census Bureau's Housing Sales Survey. Started in 1963, the survey collects information on the physical characteristics and the transaction prices of new one-family houses sold. This is done through monthly interviews with the builders or owners of a national sample of these houses. The size of the sample is currently about 15,000 observations per year.

The price index is intended to measure changes over time in the sale prices of new one-family houses which are the same with respect to ten important characteristics as the houses sold in the U.S. in 1974. The ten characteristics used are: floor area, number of stores, number of bathrooms, air conditioning, type of parking facility, type of foundation, geographic division within region, metropolitan area location, presence of fireplace, and size of lot. Note, however, that houses which are "the same" with regard to these particular characteristics may vary from one time period to the next in a number of ways such as workmanship, materials, and mechanical equipment. Hence, it should be kept in mind that the price index in this report only accounts for such quality characteristics insofar as they may be correlated with the ten characteristics actually used. The ten characteristics account for approximately 70 percent of the variation in selling price of new one-family houses.

The price index has been structured so that 1972 equals 100.0. The year 1972 was selected so that the index is consistent with other Government index series. The characteristics of the houses sold in 1974 were selected as the base weights for the series because that was the first year lot size data were available. The index series shown in table 1 is actually a combination of two series. From 1963 to 1973, the index is based on eight characteristics of the houses sold in 1974 (the list of 10 excluding lot size and presence of fireplaces). From 1974 on the index used all 10 characteristics. Therefore, changes in lot sizes and the number of houses having fireplaces are not accounted for in the index prior to 1974 unless they were correlated with one or more of the eight characteristics used.

Using a multiple regression procedure which involves these ten basic characteristics, an estimate is made of the average price of the kinds of houses sold in 1974 in terms of what they would have sold for in each of the other time periods. These estimated average prices are shown in table 00 (sixth column) and are the basis for the index numbers shown in column 1.

Since the price index applies to total sales price, it covers not only the cost of labor and materials, but also land costs, direct and indirect selling expenses and seller's profits. The index is thus conceptually broader in coverage than a cost index. Reflecting the sales price, the price index is affected by all factors which influence movements of house prices - both supply factors such as wage rates, materials cost and productivity, and demand factors such as demographic changes, income, and availability of mortgage money.

The price index is computed from actual transaction prices, including value of the developed lot, of houses built for sale and actually sold by merchant or speculative builders. Excluded from the index are houses for which the owner hired a single general contractor to build the house, or acted as his own general contractor or for which he did some or all of the work. A "house sold" is one in which a sales contract is signed at any stage of construction and the month of sale refers to the contract date.

Because the price index is based on fixed proportions of 10 characteristics of new houses sold in 1974, movements of the price index may differ greatly from changes in the average sales price of new houses actually sold during each period. Unlike the price index, the average sales price of new houses actually sold may change from one period to the next not only because of price changes which are independent of qualtiy, but also because of shifts in quality; i.e., the proportions of new houses with different characteristics. For example, the price index increased 19.2 percent from 1974 to 1976 in the United States whereas the average price of new houses actually sold during this period increased 23.4 percent owing to an overall shift towards the construction of larger houses and houses with more amenities.

This comparison may be clearer if one were to think of the price index in terms of the average prices of kinds of houses sold in 1974. The price index indicates that new houses sold in 1974 which had an average sales price of \$38,900 would have sold for \$46,400 in 1976. However, the actual average price of new houses sold in 1976 was \$48,000. The difference of \$1,600, as stated above, may be attributed to the shift towards larger houses and houses with more amenities.

Chapter 5

In 1974 houses with price per square foot greater than \$24.00 have been included with those in the \$21.00 to \$23.99 range.

APPENDIX A

Description of Survey

The statistics in this annual report are estimates derived from monthly sample surveys conducted by the Bureau of the Census, U.S. Department of Commerce, under contract with the U.S. Department of Housing and Urban Development. The information is obtained by conducting monthly interviews with the builders or owners of new housing units selected by a national probability sample of new housing units for which permits have been issued or, in nonpermit areas, on which construction has started.

The sample design is nation-wide in scope spreading over 137 areas comprised of counties and independent cities. Within these 137 areas, a sample of buildings is obtained each month from approximately 950 places requiring the issuance of building permits. The sampling involves a selection of permits based upon the number of housing units reported on the permit. The probability of selection of a permit is proportionate to the number of housing units reported on that permit. All buildings and housing units therein covered by the selected permits are in the sample.

Of these 137 areas, 100 contain places not issuing building permits. In these "nonpermit places", a sample of buildings and housing units is obtained using the following method:

- 1. Each month a list of all residential construction is obtained from a selected source group of people considered most likely to know about local housing activity.
- 2. A subsample of 200 predesignated land area segments, located throughout the nonpermit portion of the 100 areas, is canvassed each month by interviewers to obtain a list of all residential construction occurring in these segments not reported by the source group of people.

Once a building is in the sample, it is followed through to completion and, where applicable for single-family houses, sale. The only exception to this is that single-family houses listed by the source group of people in the nonpermit places are not followed through to completion and, if applicable, sale. Rather, those single-family houses the interviewers have listed in the segments of nonpermit places are followed through to completion, and, if applicable, sale. Each of these cases is given a special weight to compensate for excluding the source reported single-family cases.

Overall, the sample consists of approximately 3 percent of all estimated single family housing units started and approximately 40 percent of all the estimated units in multi-family structures started. Of all the multi-family structures started, approximately 45 percent of the units in structures containing five units or more come into the sample whereas only about 7 percent of

those units in buildings with two to four units come into the sample.

The statistics in this annual report are based on data received as late as March 1978. It is estimated that about one percent of all housing sales and completions which occurred during 1977 still had not been reported by that date. Imputations have been made to cover this small amount.

Most statistics shown have been adjusted to eliminate nonreporting from the tables. Cases not reporting a characteristic have been distributed proportionally to those reporting the characteristic. For example, assume that of those cases for which information on air-conditioning was reported, 75 percent indicated that air-conditioning was installed and 25 percent indicated that it was not installed. Then, 75 percent of those cases, which did not report whether air-conditioning was or was not installed, would be added to the air-conditioning installed estimate, and 25 percent would be added to the "not installed" estimate.

It is feasible to do this only when the percentage of cases reporting a given characteristic is at a statistically acceptable level. For this report that has been determined to be 75 percent reporting. If this test is failed, the statistics have been supressed in most cases. There are exceptions, and tables displaying these exceptions have been marked to warn the user of potential weaknesses in the estimates.

SAMPLING VARIABILITY

The statistics shown in this report are estimates from a sample survey and may differ from statistics which would have been obtained from a complete census using the same schedules and procedures. An estimate based on a sample survey is subject to both sampling error and nonsampling error. The accuracy of a survey result is determined by the joint effects of these errors. Sampling error reflects the fact that only a particular sample was surveyed rather than the entire population. Estimates of size of sampling errors are provided by the standard error of the estimate. Nonsampling errors can be attributed to many sources: inability to obtain information about all cases in the sample; definitional problems; differences in interpretation of questions; inability or unwillingness of respondents to provide correct information; and errors made in processing data. No explicit measures of the effects of nonsampling errors are available; however, it is believed that most of the important operational errors were detected in the course of reviewing the data for reasonableness and consistency. As calculated for this report, the estimated standard errors include part of the effect of nonsampling errors but do not measure any systematic biases in the data.

The particular samples selected for the Survey of Housing Starts, Sales, and Completions are each one of a large number of similar probability samples that, by chance, might have been selected using the same specifications. Estimates derived from the different samples would differ from each other. The standard error or sampling error of a survey estimate is a measure of the variation among the estimates from all possible samples and thus is a measure of the precision with which an estimate from a particular sample approximates the average results of all possible samples.

The sample estimate and an estimate of its standard error permit us to construct interval estimates with prescribed confidence that the interval includes the average result of all possible samples.

To illustrate, if all possible samples were selected, each of these were surveyed under essentially the same conditions, and an estimate and its estimated standard error were calculated from each sample, then:

- 1. Approximately two-thirds of the intervals from one standard error below the estimate to one standard error above the estimate would include the average value of all possible samples. We call an interval from one standard error below the estimate to one standard error above the estimate a two-thirds confidence interval.
- 2. Approximately nineteen-twentieths of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples. We call an interval from two standard errors below the estimate to two standard errors above the estimate a 95 percent confidence interval.
- 3. Almost all intervals from three standard errors below the sample estimate to three standard errors above the sample estimate would include the average value of all possible samples.

The average value of all possible samples may or may not be contained in any particular computed interval. But for a particular sample, one can say with specified confidence that the average of all possible samples is included in the constructed interval.

To derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result the standard errors shown in tables A-1 through A-5 provide orders of magnitude rather than precise values of the standard errors of various estimates given in this report.

Table A-1 shows the standard errors of estimated numbers of new houses; tables A-2 and A-3 show standard errors of estimated percentages; and table A-4 shows the relative standard errors of estimates of median square feet of floor area and median sales price. Table A-5 shows relative standard errors of estimates of characteristics of buildings with 2 units or more completed in 1977.

Owner-built houses							
completed	6	9	4	7	9	5	3
Median sales price for new							
houses sold	1	1	4	5	2	1	1

Illustrated uses of standard errors tables:

Table 18 shows that the estimate of the number of new houses sold in the South region with sales price between \$50,000 and \$59,999 is 50,000 houses. Table A-1 shows that the estimated standard error of 50,000 for new houses sold is 5,100. This means that we are confident, with approximately two chances out of three of being correct, that the average estimate, from all possible samples, would be between 44,900 and 55,100 houses. Doubling the interval gives us limits of 39,800 and 60,200 and increases our confidence of being correct to 19 out of 20 times.

The estimate of the proportion of houses sold in the South region with sales price between \$50,000 and \$59,999 is 16 percent of all houses sold in the South region (a total of 317,000 houses). Using interpolation in table A-2 the standard error of 16 percent with a base of 317,000 houses is approximately 1.3 percentage points. This means that we are confident with approximately two chances out of three of being correct, that the average estimate, from all possible samples, of the proportion of houses sold in the South region with sales price between \$50,000 and \$59,999 would be between 14.7 and 17.3 percent. Doubling the interval gives

us limits of 13.4 and 18.6 percent and increases our confidence of being correct to 19 out of 20 times.

Table 18 also shows that the median sales price of new houses sold during 1977 in the South region was \$44,100. Table A.4 shows that the relative standard error of the estimate is 1 percent. Multiplying \$44,100 by .01 we obtain \$441 as the standard error. This means that we are confident, with approximately two chances out of three of being correct, that the average estimate from all possible samples would be between \$43,659 and \$44,541. Doubling the interval gives us limits of \$43,218 and \$44,982 and increases our confidence of being correct to 19 out of 20 times.

Table 16 shows that 37,000 of the buildings with two units or more completed in the United States in 1977 had electricity for heating fuel. Table A-5 shows that the relative standard error of the estimate is 5 percent. Multiplying 37,000 by .05 we obtain 1,850 as the standard error. This means that we are confident, with two chances out of three of being correct, that the average estimate, from all possible samples, or multi-family buildings completed in 1977 with electricity for heating fuel is between 35,150 and 38,850 buildings. Doubling the interval gives us limits of 33,300 and 40,700 and increases our confidence of being correct to 19 out of 20 times.

APPENDIX B

Definitions

Appliances in Sales Price. The tabulations on appliances include only the selected appliances (stove, dishwasher, and refrigerator) which are included in the sales price at the time the original agreement is signed or the deposit made. These data include only the appliances that are included in the original agreement; that is, any appliances which are subsequently purchased from the builder and included in the sales price at the time of final settlement are not included in this survey.

Bathroom. For the purposes of this survey, a full bathroom is one that has a wash basin, a toilet and either a bathtub or shower or a combination of bathtub and shower. A half bathroom is one that has either a toilet, bathtub or shower, but not all the facilities to be classified as a full bathroom. If the respondent reported a full bathroom and two half bathrooms, the house was classified as a 2-bathroom house.

Bedroom. A bedroom is a finished room specifically designed to be used for sleeping. A den or a space in the attic or basement which could be converted to a bedroom is not counted as a bedroom.

Closing Costs. The closing costs are the total estimated costs customarily chargeable to the buyer for items which are incidental to the transaction. These costs include mortgagee's initial service charge, cost of title search, charges for the preparation of deed and mortgage documents, mortgage tax, recording fees, and similar items. They include, in addition, for houses sold with FHA-insured mortgages, an examination or application fee. Items not included in closing costs are deposits for unaccrued taxes, insurance premiums, and similar items that are treated as prepayable expenses.

Contractor-Built Houses. This category includes all houses built for owner occupancy on owner's land, with construction under the supervision of a single general contractor.

Contract Price. The contract price used in this survey for contractor-built houses is the price on the original contract awarded to the general contractor. The contract price does not reflect any subsequent changes in the price resulting from change orders or from any other factors affecting the price of the house. It does not include the cost of any contracts awarded to a different contractor for work on the grounds around the house, nor does it include any proposed expenditures on the house after construction is completed by the general contractor. Finally, because the house is being built for the owner's occupancy on his own land, the contract price does not include the cost of land.

The median contract price is equal to the middle point of all contract prices reported. The point is so chosen that half the houses started reported a contract price amount below that shown as the median and half with an amount above. The average - or arithmetic mean - contract price is obtained by dividing the sum of all contract price amounts by the number of houses reporting contract prices.

Downpayment. The downpayment is the amount reported as agreed upon at the time the original sales agreement was signed or deposit accepted. Changes in type of financing, sales price due to revised building specifications, and other causes may affect the size of the downpayment after the initial agreement. Any such changes made after the original sale is reported are not reflected in the tables.

Exterior Wall Material. The statistics on exterior wall material relate only to the principal type used; that is the material covering more than half the exterior wall.

Financing Type of. The type of financing tabulated in this survey is the type reported at the time the original sales agreement was signed or deposit accepted. However, changes in the type of financing do occur between the original contract signing and final settlement. These changes are not reflected in the tables.

The FHA and VA type of financing data presented in this report tend to differ somewhat from those published directly by those agencies. This report reflects the type of financing reported at the time the original sales contract was signed and provides data on the relative importance of the various types of financing. For the actual number of FHA-insured and VA-guaranteed loans made for new houses at the time of final settlement, refer to the publications of the respective agencies. The data differ because of the difference in time periods between the signing of the original sales contract, the start of construction, and the insurance or guarantee of the mortgage, as well as the sampling variability in this survey.

Fireplace (indoor). An indoor fireplace is defined as an open recess in a chimney in which a fire may be built. An indoor fireplace is usually constructed of brick, stone or other types of masonry and is a fixed and integral part of the building.

Floor Area. For this survey, floor area is defined as the floor area of all completely finished floor space, including space in basement and attic with finished walls, floors, and ceilings.

In concept, measurement is based on exterior dimensions. Measurements are taken to the outside of exterior walls for detached houses. Half stories are measured to the outside of enclosing partitions. Row houses are measured from the center-line of party walls and to the outside surface of the exterior walls. For purposes of this survey, where the floor area for a new house was reported in interior dimensions, the figure was converted to exterior dimensions by multiplying by a standard conversion factor of 1.08. A standard conversion factor of 1.04 was used to convert figures to exterior dimensions where it was not known whether the reported area was based on exterior or interior dimensions. Prior to 1969, the conversion factor of 1.04 was not used and these cases were considered as not reporting square foot area.

Geographic Regions. The standard census geographic regions are used in the tables of this report. States contained in each region are as follows:

Northeast. Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania; North Central—Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas; South—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas; West—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska and Hawaii.

Heating System. For purpose of this survey, heating systems are grouped into two built-in categories: (1) central heating systems including warm air ducted, hot water or steam systems; and (2) built-in heating systems for individual rooms—including electric baseboard, panel or radiant, floor or wall furnances, and room or space heaters. A home heated with a portable unit is considered as having no built-in heating system. Heat pumps and electric furnances are included in central: warm air.

Housing Unit. A housing unit is defined as a single room or group of rooms intended for occupancy as separate living quarters by a family, by a group of unrelated persons living together, or by a person living alone. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which has either (1) direct access from the outside of the building or through a common hall, or (2) complete kitchen facilities for the exclusive use of the occupants.

In addition to single-family detached houses, the definition of single-family houses also includes those townhouses attached together in groups of two or more which are partitioned from each other by an unbroken ground to roof wall (no common attic or basement) and in which each unit has its own separate utilities not shared with any other unit.

New Houses Built for Sale Completed. This category includes new houses completed—built for sale whether sold or for sale by end of year.

New Houses Sold. The houses sold category includes all houses for which a sales contract has been signed between the seller and purchaser. This includes houses for which a sales contract is signed before construction is actually started; that is, houses sold from a model or from plans for which the builder has a signed contract before any work is started on the footings or foundations. It also includes houses sold while under construction or after completion; that is, houses built on speculation.

Owner-Built Houses. This category includes houses built for owner occupancy, on owner's land, under the supervision of the owner acting as his own general contractor: (1) In most cases built partly by owner and partly with paid help; (2) sometimes built entirely with the employment of subcontractors; and, (3) in a smaller number of cases, built entirely on a "do-it-yourself" basis.

Rental Houses, This category includes houses built for rent.

Response Rate. The overall response rate for all new houses covered by this survey is very high. Practically everyone asked responded to the questionnaires shown in appendix C. However, response to individual items varied. For the physical characteristics, such as number of bedrooms or bathrooms, the response rate is within the range of 90 to 99 percent. Items with response rates somewhat lower are those related to the sales price of new houses sold or the contract price of contractor-built houses started.

Sale. The sale of the new house occurs with the signing of a sales contract or the acceptance of a deposit. This survey does not follow through to the final stage of the sales transaction.

Sales Price. The sales price used in this survey is the price agreed upon between purchaser and seller (and reported by the latter) at the time the first sales contract is signed or deposit is made for the house. The sales price does not reflect any subsequent price changes resulting from change orders or from any other factors affecting the price of the house. Furthermore, the sales price does not include the cost of any "extras" or "options" paid for in cash by the purchaser or otherwise not included in the original sales price reported by the seller.

The median sales price is the sales price of the house which falls on the middle point of the total annual number of houses sold; the point is so chosen that half the houses were sold with a sales price amount below that shown as the median amount and half with an amount above. The average of arithmetic mean—sales amount is obtained by dividing the sum of the total sales amount reported for all houses in the annual series by the number of houses sold in the corresponding year.

Stages of Construction-

<u>Start</u>—A house is defined as started at the time of excavation for the footings or foundation.

Completion-A house is defined as completed when all finish flooring has been installed (or carpeting if used in place of finish flooring). If the building is occupied before all construction is finished, it is classified as completed at the time of occupancy. In privately owned buildings with two or more housing units, all the units in the buildings are counted as completed when 50 percent or more of the units are occupied or available for occupancy. Approximately 90 percent of the multi-unit buildings have from 2 to 19 housing units and in most of these buildings all units within the building actually become available for occupancy at substantially the same time. In some larger apartment buildings, some floors or some units are completed and occupied before other parts of the building are completed. In these cases, housing units counted as completed prior to completion of the entire building tend to be offset by those housing units actually completed during that month but which had been counted as completed previously. Public housing units in all structures are counted as completed when reported completed by the housing authority or other owning public agency.

Story—This portion of a building between the floor and the ceiling or roof, or the next floor above in the case of a multistory house. A basement is not counted as a story even if it is finished as a den or recreation room. Houses referred to as "bi-levels" or "split foyers" are classified as 2-story houses.

Half story—A story finished as living accommodations located wholly or partly within the roof frame is considered a half story; it is tabulated in this survey as whole story; for example, one and one-half stories is counted as two.

Split level—Identifies a structure having floors on more than

Split level—Identifies a structure having floors on more than one level when the difference in some floor levels is less than one story. This definition is interpreted on the basis of local customs and may vary from area to area.

Standard Metropolitan Statistical Areas—The distribution of the data presented in this report between inside and outside Standard Metropolitan Statistical Areas (SMSA's) is based on the definitions published by the Bureau of the Budget in its recurring series Standard Metropolitan Statistical Areas. To the extent possible, the effort is made to use in each year the latest available definitions, incorporating the most recent (generally annual) amendments.
